NEW QUESTION: 1

Which of the following can be mitigated with proper secure coding techniques?

- A. Header manipulation
- B. Error handling
- C. Input validation
- D. Cross-site scripting

Answer: C

NEW QUESTION: 2

Your company has a private cloud that is managed by using a System Center 2012 infrastructure.

The network contains a Virtual Machine Manager (VMM) infrastructure and an Operations Manager infrastructure.

You create and deploy a three-tier service to VMM.

You plan to view service diagrams in Operations Manager.

You need to identify which management packs must be imported to Operations Manager for the planned diagrams.

The solution must minimize the number of imported management packs.

Which management packs should you identify? (Each correct answer presents part of the solution. Choose all that apply.)

- A. the Monitoring Pack for Active Directory (AD)
- B. the Windows Server Operating System management pack
- C. the Windows Server DNS 2003/2008/2008 R2 Monitoring Management Pack
- D. the Microsoft SQL Server Monitoring Management Pack
- E. the Internet Information Services 7 Monitoring management pack
- F. the File Services management pack

Answer: B,D,E

Explanation:

Information on three-tier service in VMM:

<http://blogs.technet.com/b/m2/archive/2011/03/29/how-to-deploy-thepet-shop-application-as-a-service-invmm.aspx> Three tiers are Web tier, Middle tier, and SQL tier. A) The Windows Server Operating System management pack provides the fundamental monitoring basics for computers running the Windows 2000 Server and Windows Server 2003, 2003 R2, 2008 and 2008

R2 Operating System B) The Internet Information Services Management Pack provides proactive and reactive monitoring of your Internet Information Services (IIS) environment. C) The File Services management pack retrieves events and other health information generated by the services that make up the File Services role.

D) The Monitoring pack for SQL Server provides the capabilities for Operations Manager 2007 R2 and Operations Manager 2012 to discover SQL Server 2005, 2008, 2008 R2, and SQL Server 2012.

It monitors SQL Server components such as database engine instances, databases, and SQL Server agents.

E) The Monitoring Pack for Active Directory (AD) provides both proactive and reactive monitoring of your Active Directory deployment.

F) This management Pack monitors DNS infrastructure health, availability and performance on Microsoft Windows server 2003/2008/2008 R2.

NEW QUESTION: 4

A set of CSV files contains sales records. All the CSV files have the same data schema.

Each CSV file contains the sales record for a particular month and has the filename sales.csv.

Each file is stored in a folder that indicates the month and year when the data was recorded.

The folders are in an Azure blob container for which a datastore has been defined in an Azure Machine Learning workspace. The folders are organized in a parent folder named sales to create the following hierarchical structure:

At the end of each month, a new folder with that month's sales file is added to the sales folder. You plan to use the sales data to train a machine learning model based on the following requirements:

* You must define a dataset that loads all of the sales data to date into a structure that can be easily converted to a dataframe.

* You must be able to create experiments that use only data that was created before a specific previous month, ignoring any data that was added after that month.

* You must register the minimum number of datasets possible.

You need to register the sales data as a dataset in Azure Machine Learning service workspace. What should you do?

A. Create a tabular dataset that references the datastore and explicitly specifies each 'sales/mm-yyyy/ sales.csv' file every month. Register the dataset with the name sales_dataset each month, replacing the existing dataset and specifying a tag named month indicating the month and year it was registered. Use this dataset for all experiments.

- B.** Create a tabular dataset that references the datastore and specifies the path 'sales/*/sales.csv', register the dataset with the name sales_dataset and a tag named month indicating the month and year it was registered, and use this dataset for all experiments.
- C.** Create a new tabular dataset that references the datastore and explicitly specifies each 'sales/mm-yyyy/ sales.csv' file every month. Register the dataset with the name sales_dataset_MM-YYYY each month with appropriate MM and YYYY values for the month and year. Use the appropriate month-specific dataset for experiments.
- D.** Create a tabular dataset that references the datastore and explicitly specifies each 'sales/mm-yyyy/ sales.csv' file. Register the dataset with the name each month as a new version and with a tag named month indicating the month and year it was registered. Use this dataset for all experiments, identifying the version to be used based on the

Answer: B

Explanation:

Explanation

Specify the path.

Example:

The following code gets the workspace existing workspace and the desired datastore by name. And then passes the datastore and file locations to the path parameter to create a new TabularDataset, weather_ds.

```
from azureml.core import Workspace, Datastore, Dataset
datastore_name = 'your datastore name'
# get existing workspace
workspace = Workspace.from_config()
# retrieve an existing datastore in the workspace by name
datastore = Datastore.get(workspace, datastore_name)
# create a TabularDataset from 3 file paths in datastore
datastore_paths = [(datastore, 'weather/2018/11.csv'),
(datastore, 'weather/2018/12.csv'),
(datastore, 'weather/2019/*.csv')]
weather_ds = Dataset.Tabular.from_delimited_files(path=datastore_paths)
```
